Background:	This gene is a member of the zyxin family and encodes a protei n with three LIM zinc-binding domains. This protein localizes to focal adhesion sites and along actin stress fibers. Recruitment of this protein to the plasma membrane occurs in a lysophosphatidi c acid (LPA)-dependent manner and it regulates LPA-induced cell migration. Alternatively spliced variants which encode different pr otein isoforms have been described; however, not all variants ha ve been fully characterized.
