技术规格

Background:	The product of this gene is part of a large complex local ized to the cytoplasm, nucleoli, and to discrete nuclear b odies called Gemini bodies (gems). The complex function s in spliceosomal snRNP assembly in the cytoplasm, and regenerates spliceosomes required for pre-mRNA splicing in the nucleus. The encoded protein directly interacts wit h a DEAD box protein and several spliceosome core prot eins. Alternatively spliced transcript variants have been d escribed, but their biological validity has not been deter mined.
