| Background: | Acts as a guanine nucleotide exchange factor (GEF) which differen tially activates the GTPases RHOA, RAC1 and CDC42. Plays a role in axon guidance regulating ephrin-induced growth cone collapse and dendritic spine morphogenesis. Upon activation by ephrin thr ough EPHA4, the GEF activity switches toward RHOA resulting in i ts activation. Activated RHOA promotes cone retraction at the ex pense of RAC1- and CDC42-stimulated growth cone extension (By similarity). |
