### 技术规格

<b>Background:</b>	G proteins mediate a number of cellular processes. The protein encoded by this gene belongs to the RGS (regulators of G-protein signaling) family and specifically interacts with G protein, GAI3. This protein is a guanosine triphosphatase-activating protein that functions to down-regulate Gαi/Gαq-linked signaling. Alternatively spliced transcript variants encoding the same protein isoform have been found for this gene.
