技术规格

Background:	The glycoprotein encoded by this gene is a cell surface antigen that is expressed in greater than 95% of human colon cancers. The open reading frame encodes a 319-amino acid polypeptide having a putative secretory signal sequence and 3 potential glycosylation sites. The predicted mature protein has a 213-amino acid extracellular region, a single transmembrane domain, and a 62-amino acid intracellular tail. The sequence of the extracellular region contains 2 domains characteristic of the CD2 subgroup of the immunoglobulin (Ig) superfamily.
Applications:	ELISA, IHC
Name of antibody:	GPA33

Immunogen:	Fusion protein of human GPA33
Full name:	glycoprotein A33 (transmembrane)
Synonyms :	A33
SwissProt:	Q99795
ELISA Recommended dilution:	2000-5000
IHC positive control:	Human colon cancer and human gastric cancer
IHC Recommend dilution:	50-200
